

Round 9 -- all 22 real commas (InDesign reference)

prev->,->next delta note

1 de->,->ka 1.01em noise, span-1

2 ha->,->tou 1.01em noise, span-1

3 ta->,->to 0.75em REAL, span-2

4 ba->,->do 0.75em REAL, span-2

5-21 (17 commas) 1.00em plain Tj, zero deviation

22 se->, (end) n/a last glyph

20 of 22: exactly uniform 1em.

2 of 22: negligible +0.01em noise (span-1 only).

2 of 22: real 0.25em compression (span-2 only).

Round 9 -- the two real exceptions, local context

Exception 1: ...T 0c0_0 0hŠ 0c0f0W0~0H0p ...

before-YPt=490.25 after-YPt=483.50

actual delta = 6.75pt = 0.75em

run position: 5/54 from start, 48/54 from end (mid-run)

Exception 2: ...l 0e0Q0p0 0i0S0x^L0O ...

before-YPt=294.50 after-YPt=287.75

actual delta = 6.75pt = 0.75em

run position: 27/54 from start, 26/54 from end (mid-run)

Both sit in TJ-span-2 only. TJ-span-1's own 2 real commas (de->,->ka and ha->,->tou) show NO such compression -- ruling out a fixed per-character comma rule.

Round 9 -- classification: D

InDesign paragraph-composition/justification artifact, specific to one paragraph's own layout pass -- NOT a general Japanese mojikumi rule TateSpun is missing.

TateSpun's Natural Pitch (uniform 1em, no per-document justification engine) is an intentional, frozen design.

Real InDesign rendering of TateSpun's own equivalent text (typography-parity-comma-quarter-em-tatespun-exception1/2.pdf) shows uniform spacing throughout, as architecturally guaranteed -- this is by design, not a defect requiring a fix.

No production code changed. No Implementation Gate met.
